Encoder decoder

1 hour 30 minutes Free

Overview

Duration is 1 min

In this notebook, you will use encoder-decoder architecture to create a text translation function.

Learning Objectives

In this lab, you will:

- Create a `tf.data.Dataset` [WellSaid please say `tf dot data dot dataset`] for a seq2seq problem.
- Train an encoder-decoder model in Keras for a translation task.
- Save the encoder and the decoder as separate model.
- Merge the trained encoder and decoder into a translation function.

Setup

For each lab, you get a new Google Cloud project and set of resources for a fixed time at no cost.

1. Sign in to Qwiklabs using an **incognito window**.
2. Note the lab's access time (for example, `1:15:00`), and make sure you can finish within that time. There is no pause feature. You can restart if needed, but you have to start at the beginning.
3. When ready, click **Start lab**.
4. Note your lab credentials (**Username** and **Password**). You will use them to sign in to the Google Cloud Console.
5. Click **Open Google Console**.
6. Click **Use another account** and copy/paste credentials for **this** lab into the prompts. If you use other credentials, you'll receive errors or **incur charges**.
7. Accept the terms and skip the recovery resource page.

Note: Do not click **End Lab** unless you have finished the lab or want to restart it. This clears your work and removes the project.

Setup your environment

Enable the AI Platform Training & Prediction API

1. On the Navigation menu, navigate to **APIs & services > Library** and search for AI Platform Training & Prediction API in the search box.
2. Click on **AI Platform Training & Prediction API**, then click **Enable**.

Enable the Vertex AI API

1. In the Google Cloud Console, on the Navigation menu, click **Vertex AI**, and then click **Enable Vertex AI API**.

Create Cloud Storage Bucket

1. On the Navigation menu, navigate to **Cloud Storage** and Click on **Create bucket**.
2. Set a unique name (use your project ID because it is unique). Then, click **Create**.

Launch Vertex AI Notebooks

1. In the Google Cloud Console, on the **Navigation Menu**, click **Vertex AI > Workbench**.
2. On the Notebook instances page, click **New Notebook > TensorFlow Enterprise > TensorFlow Enterprise 2.3 (with LTS) > Without GPUs**.
3. In the **New notebook instance** dialog, confirm the name of the deep learning VM, if you don't want to region and zone leave all settings as they are and then click **Create**.
The new VM will take 2-3 minutes to start.
4. Click **Open JupyterLab**.
A JupyterLab window will open in a new tab.
5. You will see **Build recommended** pop up, click **Build**. If you see the build failed, ignore it.

Clone course repo within your Vertex AI Notebooks instance

To clone the training-data-analyst notebook in your JupyterLab instance:

1. In JupyterLab, to open a new terminal, click the **Terminal** icon.
2. At the command-line prompt, run the following command:

```
git clone https://github.com/GoogleCloudPlatform/training-data-analyst
```

3. To confirm that you have cloned the repository, double-click on the training-data-analyst directory and ensure that you can see its contents.
The files for all the Jupyter notebook-based labs throughout this course are available in this directory.

Reusable Embeddings

Duration is 60 min

Step 1

In the notebook interface, navigate to **training-data-analyst > courses > machine_learning > deeplive2 > text_classification > labs > rnn_encoder_decoder.ipynb**.

Step 2

In the notebook interface, click on **Edit > Clear All Outputs** (click on Edit, then in the drop-down menu, select Clear All Outputs).

Carefully read through the notebook instructions and fill in lines marked with #TODO where you need to complete the code as needed

Tip: To run the current cell you can click the cell and hit **shift + enter**. Other cell commands are found in the notebook UI under **Run**.

- Hints may also be provided for the tasks to guide you along. Highlight the text to read the hints (they are in white text).
- If you need more help, you may take a look at the complete solution by navigating to **training-data-analyst > courses > machine_learning > deepdive2 > text_classification > solutions** and opening **rnn_encoder_decoder.ipynb**.

End your lab

When you have completed your lab, click **End Lab**. Qwiklabs removes the resources you've used and cleans the account for you.

You will be given an opportunity to rate the lab experience. Select the applicable number of stars, type a comment, and then click **Submit**.

The number of stars indicates the following:

- 1 star = Very dissatisfied
- 2 stars = Dissatisfied
- 3 stars = Neutral
- 4 stars = Satisfied
- 5 stars = Very satisfied

You can close the dialog box if you don't want to provide feedback.

For feedback, suggestions, or corrections, please use the **Support** tab.
